FCC NOTICE

This equipment has been tested and found to comply with the limits for a Class B digital device, pursuant to Part 15 of the FCC Rules. These limits are designed to provide reasonable protection against harmful interference in a residential installation. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instructions, may cause harmful interference to radio communications. However, there is no guarantee that interference will not occur in a particular installation. If this equipment does cause harmful interference to radio or television reception, which can be determined by turning the equipment off and on, the user is encouraged to try to correct the interference by one or more of the following measures: (1) Reorient or relocate the receiving antenna; (2) Increase the separation between the equipment and receiver; (3) Connect the equipment into an outlet on a circuit different from that to which the receiver is connected; or (4) Consult the dealer or an experienced radio/TV technician for help.

Changes or modifications not expressly approved by the party responsible for compliance to Part 15 of the FCC Rules could void the user's authority to operate the equipment.

CE NOTICE

This equipment has been tested and found to comply with the limits for a Class B or Class 2 digital device, pursuant to EN 55022 Rules. These limits are designed to provide reasonable protection against harmful interference when the equipment is operated in a commercial environment. This equipment generates, uses, and can radiate radio frequency energy and, if not installed and used in accordance with the instruction manual, may cause harmful interference to radio communications. Operation of this equipment in a residential area is likely to cause harmful interference in which case the user will be required to correct the interference at the expense of the user.

Changes or modifications not expressly approved by the party responsible for compliance to EN 55022 Rules could void the user's authority to operate the equipment.

This Class B digital apparatus meets all requirements of the Canadian Interference-Causing Equipment Regulations.

Cet appareil numérique de la classe B respecte toutes les exigences due Règlement sur le matériel brouilleur du Canada.
Before You Begin

Biometrics Overview
Biometrics is a method of recognizing a person based on physical or behavioral characteristics. Examples of biometric information used to identify people include fingerprint, voice, face, iris, handwriting, and hand geometry.

There are two key functions offered by a biometric system. One method is identification, a “one-to-many” (1:N) matching process in which a biometric sample is compared sequentially to a set of stored samples to determine the closest match. The other is verification, a “one-to-one” (1:1) matching process in which the biometric system checks previously enrolled data for a specific user to verify whether the user is who he or she claims to be. The verification method provides the best combination of speed and security, especially where multiple users are concerned, and requires a user ID or other identifier for direct matching.

With an increasing reliance on online and mobile technology and other shared resources, more and more transactions of all types are initiated and completed online and remotely. This unprecedented growth in electronic transactions has underlined the need for a faster, more secure and more convenient method of user verification than passwords can provide. Using biometric identifiers offers several advantages over traditional and current methods. This is because only biometric authentication is based on the identification of an intrinsic part of a human being. Tokens such as smart cards, magnetic stripe cards and physical keys, can be lost, stolen, duplicated or left behind. Passwords can be forgotten, shared, hacked or unintentionally observed by a third party. By eliminating these potential trouble spots, only biometric technology can provide the security, with convenience, needed for today’s complex electronic landscape.

Advantages of Using Fingerprints

The advantages of using fingerprints include widespread public acceptance, convenience and reliability. It takes little time and effort to scan one’s fingerprint with a fingerprint reader, and so fingerprint recognition is considered among the least intrusive of all biometric verification techniques. Ancient officials used thumbprints to seal documents thousands of years ago, and law enforcement agencies have been using fingerprint identification since the late 1800s. Fingerprints have been used so extensively and for so long, there is a great accumulation of scientific data supporting the idea that no two fingerprints are alike.

About SecuGen
SecuGen (www.secugen.com) provides biometric solutions for physical and network security employing advanced fingerprint recognition technology. SecuGen’s patented and patent-pending products are renowned for their accuracy, reliability, affordability and versatility. The company’s comprehensive product line includes high quality optical fingerprint readers and sensor components, software, and development kits used for a variety of innovative applications including mobile, Internet, enterprise network and desktop security, physical access control, time and attendance management, and financial and medical records control. Based in Silicon Valley, SecuGen has been serving the biometric community since 1998 and is an active member of the Biometrics Consortium, the International Biometrics & Identification Association, and the BioAPI Consortium.
About SecuGen Products

SecuGen Sensor Qualities

- **Excellent Image Quality:** Clear, distortion-free fingerprint images are generated using advanced, patented and patent-pending optical methods. Quality imaging yields better sampling for minutiae data extraction.
- **Durability:** Mechanical strength tests show resistance to impact, shock and scratches.
- **Powerful Software:** Precise, fast processing algorithm ensures efficiency and reliability.
- **Ruggedness and Versatility:** Solid engineering and superior materials allow for use under extreme conditions.
- **Ergonomic Design:** Compact, modular design for seamless integration into small devices, ease of use, and compatibility make SecuGen sensors ideal for a broad range of applications.
- **Low Cost:** Products are developed to deliver high performance, zero maintenance at very affordable prices for general and industrial use.

Advantages of SecuGen Sensors Over Other Optical Sensors

- Unique optical method captures fine details, even from dry skin
- Extremely low image-distortion
- Reinforced materials
- Wear resistance
- Attractively small size
- Ease of integration
- Ready-to-use
- Low cost through longer life and no maintenance requirements

Advantages of SecuGen Sensors Over Semiconductor (Capacitive) Sensors

- Non-metal, non-silicon components make SecuGen sensors less susceptible to corrosion when exposed to salts, oil and moisture from skin and environment
- Superior surface properties eliminate need for costly coating and processing procedures
- Greater mechanical strength, wear-resistance, and durability
- Broader range of applicability, especially for use in extreme conditions and climates
- Immunity from electrostatic discharge
- Low cost through longer life and no maintenance requirements

Strengths of SecuGen Software and Algorithms

- Unique image processing algorithm extracts fingerprint minutiae very accurately
- High signal-to-noise ratio processing algorithm screens out false features
- Highly efficient matching algorithm
- Fast overall process of extraction, matching and verification
- Encryption function to protect user privacy
- Compatibility with existing desktop, laptop PCs interface computers
- Ease in developing applications for various purposes
1. Introduction & Installation

Thank you for choosing SecuGen® USB Fingerprint Readers!

You will find many uses for SecuGen readers – versatile, high quality scanning devices that can be used for a variety of security applications. This guide explains the different types of SecuGen readers, guides you through installation, and provides tips on usage, care and troubleshooting.

Types of USB Fingerprint Readers

It is important to know which sensor your fingerprint reader is based on to ensure that it is correctly installed and configured on your system. If you are not certain, please refer to the chart below, which lists the model numbers and product names.

<table>
<thead>
<tr>
<th>Sensor</th>
<th>Type</th>

</tbody>
</table>

Note: We use the terms reader and device interchangeably to refer to the SecuGen fingerprint reader itself.

System Requirements for Windows

USB 1.1 port, USB 2.0 port, or USB hub (self-powered for OptiMouse or Keyboard)
32MB RAM
20MB available hard disk space

If you are installing an application based on platforms other than Windows, such as Android or Linux, please refer to the documentation provided by the maker of the application program.
Driver Installation
Before using your SecuGen fingerprint reader, drivers must be installed in one of the following ways.

**For Windows users**
Drivers are automatically installed after you plug in the reader for the first time.

**If you have software for your reader**
Drivers may already be included with the installation media.

**To manually install device drivers**
If neither of the above options is available, you may download the Windows device driver from SecuGen’s website at [www.secugen.com/download](http://www.secugen.com/download).
2. How to Use Your Fingerprint Reader

For best results

Why is image quality important?
SecuGen fingerprint recognition technology is based on minutiae: the unique feature points of a fingerprint. After a fingerprint is scanned, minutiae are extracted and processed into a template that will be used for biometric enrollment and matching. If the scanned fingerprint is unclear or does not have enough contrast, the minutiae may be inconsistently sampled, resulting in less accuracy and poor performance. Certain environments and skin conditions, such as wet or dry skin, can initially cause a fingerprint to appear too light or dark. The scanning quality of SecuGen readers can be manually or automatically adjusted to overcome the enrollment or matching problems that have commonly occurred with fingers that “don’t seem to work.” More information about this is available in the next section.

Proper placement is the key to good results
SecuGen’s fingerprint extraction algorithm is capable of extracting the correct minutiae even without benefit of a perfect print. However, the proper placement of your finger while scanning can help give more consistent results for any biometric application. The suggestions below will help you get the best quality fingerprint to ensure better performance and reduce the chances for failure to enroll or match correctly.
How to scan your finger

Place the pad of your finger at the center of the sensor
The pad is the fleshy part of the finger, located in the middle of the first segment. Be sure that the pad (not the tip) covers as much of the sensor window as possible so that the core of your fingerprint can be scanned. It is okay to place your finger at an angle.

Apply light pressure
Apply pressure lightly and evenly during the scanning process. Use as much pressure needed to hold a piece of paper between your fingers. Pressing too hard may result in a dark or blurred fingerprint.

Keep your finger still
The LED will light up to scan your fingerprint. Keep your finger in place while your fingerprint is scanned.

How to find the core of your fingerprint
The core of your fingerprint is located between the middle and lower edge of the first segment of your finger. An easy way to ensure that the core is scanned is to place your finger on the reader so that the first joint of the finger aligns with the bottom edge of the sensor window.

If you cut or injure your finger
As a precaution, it is best to enroll more than one finger so that if one finger becomes unavailable for authentication, you will have an alternate finger to use. Most biometric applications provide the option to enroll multiple fingers. If your application features a password or PIN back-up, you can use this feature in case no finger or fingerprint device is available. If none of these options work, please contact your IT administrator or technical support provider for help.
Problematic fingerprints
By following the above guidelines, you should be able to get consistently good results. Sometimes, however, certain skin conditions or environments may cause poor fingerprint images. Damp skin may cause fingerprints that are too dark or smudged, but can be remedied by wiping fingers before input. If your finger is extremely dry, you can safely use a moisturizing lotion before input. Alternatively, if these problems are persistent, you can by adjust the brightness settings for your device to get the best contrast and brightness levels. For more instructions, refer to the next section.

Dry  Wet  Scarred

For Hamster readers equipped with Auto-On™

Do not place your finger too slowly or too softly
The Auto-On sensor might not detect your finger when it's placed too slowly or too softly on the reader. If the LED does not turn on, remove your finger and wait for 5 seconds to allow the sensor to reset. Then try again.

Do not wrap your fingers or hand around the top of the reader near the sensor
The Auto-On sensor might not detect your finger if your fingers are wrapped around the sides or back of the top of the Hamster. If the LED does not turn on, remove your finger and wait for 5 seconds to allow the sensor to reset. Then try again.

Avoid touching the sides and back of the Hamster Plus / Hamster IV near the top.
3. How to Adjust Your Reader

Depending on the software application you are using, you may have the option to adjust the scan settings on your fingerprint reader to get better results. For some applications, the system will automatically adjust the scan settings each time you scan a finger using the Smart Capture™ capability offered with most SecuGen fingerprint readers. If Smart Capture is not turned on, you can use the following instructions to adjust your reader.

1. From your software application, open the option to adjust the scan settings on your fingerprint reader. It might be called “Setting,” “Brightness,” “Adjustment,” or something similar to this.

2. When a window like below opens up, place your finger on your fingerprint reader, and click Preview to view your fingerprint.

![Example of fingerprint that needs to be adjusted](image)

3. For manual adjustment, click and drag the slider(s), place your finger on the reader, and then click Preview again.

   If the resulting fingerprint does not improve, you can further adjust the settings by moving the sliders.

![Slider adjustment](image)

4. To let the system automatically determine optimal settings, place your finger on the reader and then click Auto Exposure. Hold your finger still while the settings automatically change incrementally. This may take several seconds. Once completed, place your finger on the reader again, and then click Preview to view the improvement of your fingerprint.

![Auto Exposure](image)

5. To keep the new settings, click OK. To go back to the original settings, click Cancel.
4. How to Care for Your Reader

SecuGen fingerprint readers do not require any special maintenance except for occasional cleaning of the sensor window if it gets dirty. Normal oil, residue or smudges on the sensor window should not cause problems or interfere with scanning fingerprints. The sensor window was designed to withstand heavy use and extreme conditions including heat and cold. It does not have any coatings that can get damaged because it is made of a hard, quartz-like material that resists scratches, etching, and damage from environmental elements.

If you wish to clean the surface of the sensor window

- You can safely use a tissue, paper towel or cloth to wipe down the window. To remove stubborn dirt, you can wipe the window with a cloth dampened with a soap solution. Squeeze out excess liquid before wiping with the damp cloth.
- Cleaning agents like glass cleaners and anti-bacterial wipes may be used without harming the sensor. However, as with most plastic material, the housing of the unit may be damaged if strong solvents, acids or caustic solutions are used.
- Do not pour liquids directly onto the sensor or device, as the liquid might seep into the underlying components and cause damage.
5. About Fingerprint Privacy

Fingerprint images are never stored.

SecuGen fingerprint recognition technology is based on minutiae, the feature points around the core of your fingerprint. When a fingerprint is scanned, only a portion of the minutiae are sampled, and then processed by an extraction algorithm and converted into a template. After the template is formed, the fingerprint image is deleted. When fingerprints are used in the form of templates, there is no need to store fingerprint images.

Fingerprint images cannot be reconstructed from minutiae or templates.

The minutiae that are sampled from a fingerprint do not have enough information to recreate an image of the fingerprint. Additionally, minutiae cannot be extracted from a template because the mathematical conversion from minutiae to template is irreversible. As an extra measure of security, depending on the application you are using, templates may be secured using advanced encryption to further protect the template data.
6. Troubleshooting

Windows is warning me that the driver has not passed Windows Logo testing.
If you are a Windows user and you see a warning box that says the SecuGen device driver has not passed Windows Logo testing, please click the “Continue Anyway” button. Our drivers have been tested thoroughly with all Windows version listed in System Requirements. Drivers are regularly updated for Windows compatibility and should be automatically downloaded from Microsoft's Windows Update web site and included in future Windows Service Packs. ([www.windowsupdate.com](http://www.windowsupdate.com)).

My SecuGen USB reader does not power on.
If you have connected the reader to a USB port in a USB keyboard or hub, verify that the USB keyboard or hub has its own power-supply. Some SecuGen readers use up to 150 mA of electric current, so if they are not already connected directly to the computer, then they should be connected to hubs that are self-powered.

My USB reader powers on but cannot scan fingerprints.
When you have other high-speed USB devices, such as a digital camera or scanner, connected to your computer, the SecuGen reader cannot be used at the same time. SecuGen USB readers may use up to 66% of USB 1.1 bandwidth, and therefore cannot function concurrently with any other device using more than 40% of the bandwidth. Close the programs that use the other USB devices, and if necessary, disconnect those devices, before using the SecuGen reader.

My USB reader powers on but sometimes cannot scan fingerprints.
If you are using a reader that is equipped with Auto-On™, you might be experiencing interference with the Auto-On sensor. To reset the Auto-On sensor, remove you finger from the reader and wait 5 seconds. To prevent this problem, see the tips in section 2.

My OptiMouse is very slow.
When certain other mouse drivers are installed on your computer, the USB OptiMouse response may be slow. Click Start > Control Panel > Mouse and the Operation tab to adjust the speed of mouse pointer. If you cannot adjust the speed of mouse pointer, remove the other mouse driver from the system.

My OptiMouse doesn’t work.
First verify that the OptiMouse is connected to the USB port correctly. Then click Start > Control Panel > System and select the Device Manager tab to verify that the mouse drivers are installed correctly. If they are not installed correctly, repeat the driver installation process.

My USB reader is not recognized.
If you are using an FDU01 or FDU02 based reader, be sure to use the appropriate device driver from SecuGen’s website at [www.secugen.com/download](http://www.secugen.com/download). Although older FDU01 devices can work with FDU02 device drivers, readers based on FDU02 cannot work with FDU01 device drivers.
